- Colour
- Posters
- Accessible visualisation
- Key takeaways
- Tools and resources

What is data?

Definition Wikipedia (computer science):

Data requires [interpretation](#) to become [information](#). [Digital data](#) is data that is represented using the [binary number](#) system of ones (1) and zeros (0), instead of [analog](#) representation. In modern (post-1960) computer systems, all data is digital.

Definition according to EOSC:

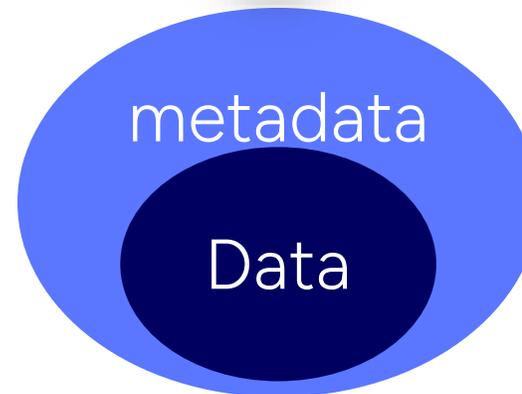

reinterpretable digital representation of information in a formalized manner suitable for communication, interpretation, or processing.

What is metadata?

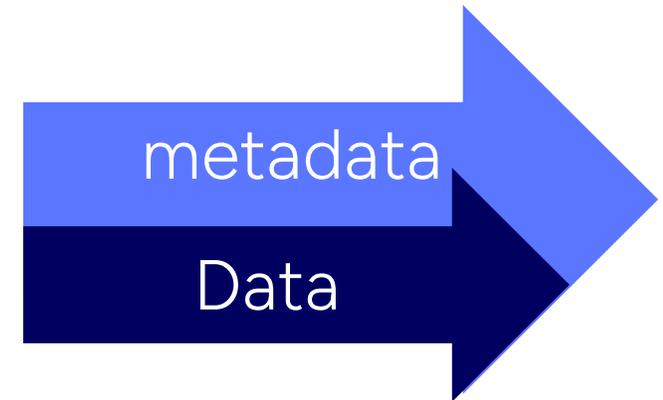

Metadata = data about data, often the information needed to interpret data in a meaningful context, (technical, administrative, descriptive metadata)

Good questions to ask before DataViz

(from 5W + 1H)

- **What?**
 - My Research Data
 - Our analysis workflow
 - A generalizable concept
 - An observed relationship
- **Why?**
 - To verify quality (QC)
 - To explore
 - To explain (to whom?)
- **How?**
 - What type of plot or diagram can I use to convey this?
- **What aspect of the data?**
 - Distribution
 - Comparison
 - Relationship
 - Composition

What?

- **Data**

- Raw data
- Transformed or normalised data
- Transcribed data
- Random data
- Statistical calculations
- Approximations, estimates or projections

- **Conceptual**

- Graphical abstract
- Infographics
- Descriptive diagrams

Why?

- **Purpose** – What are you trying to achieve?
 - Quality control
 - Explore the data for analysis purposes
 - Explain the data or the results of an analysis
- **Audience**
 - Myself
 - Other researchers in my field (e.g. my PI)
 - Other researchers in a separate field
 - General public
- **Context**
 - Slide show presentation
 - Conference poster
 - Journal article

A QC example

- What?
 - Data on gene expression levels (**numerical values**) for 1000 genes in different cancer cell lines of different types
- Why?
 - Quality control – ensure that gene expression on an overall level (**distribution**) is similar.
- How?
 - Boxplot to see distribution of the numerical value (gene expression) for each cell line.

CCLE - Lung cancer gene expression levels

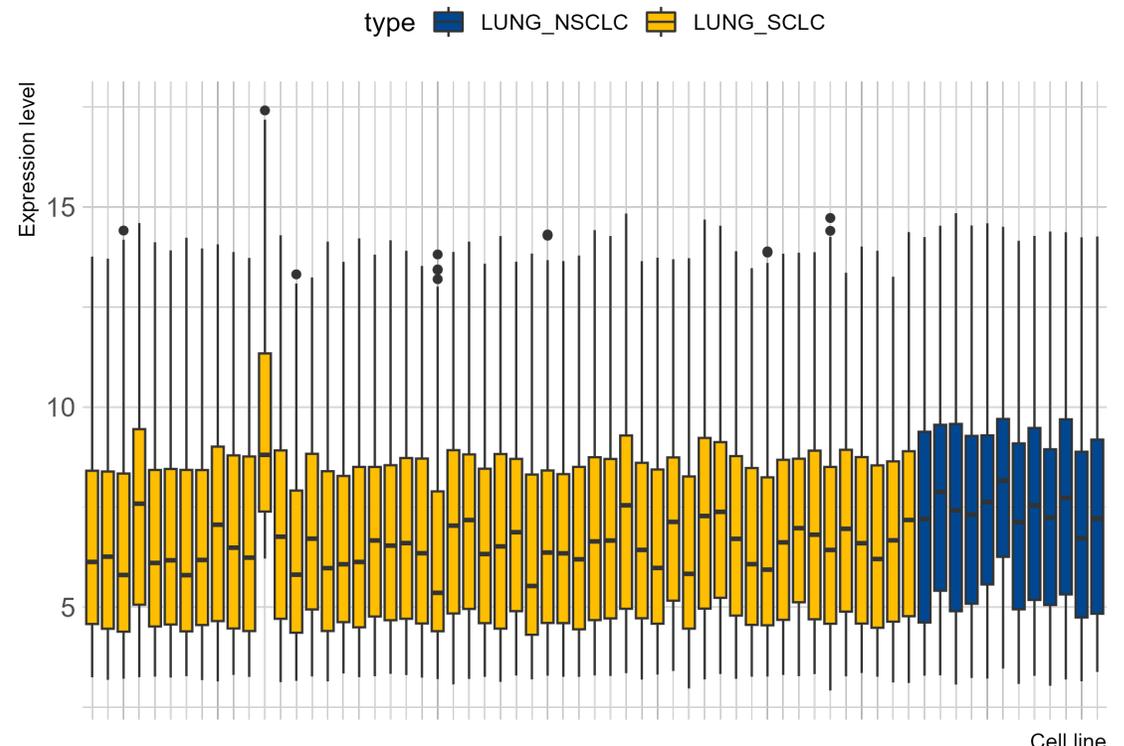

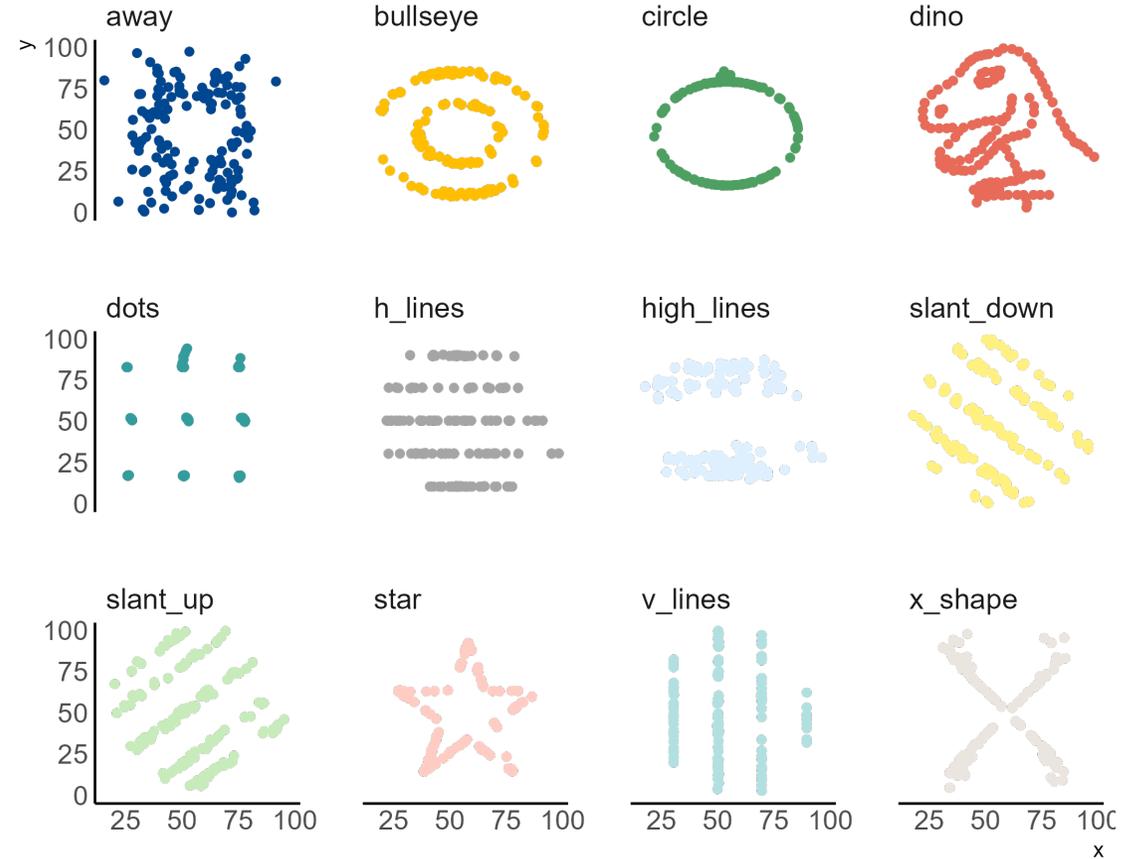

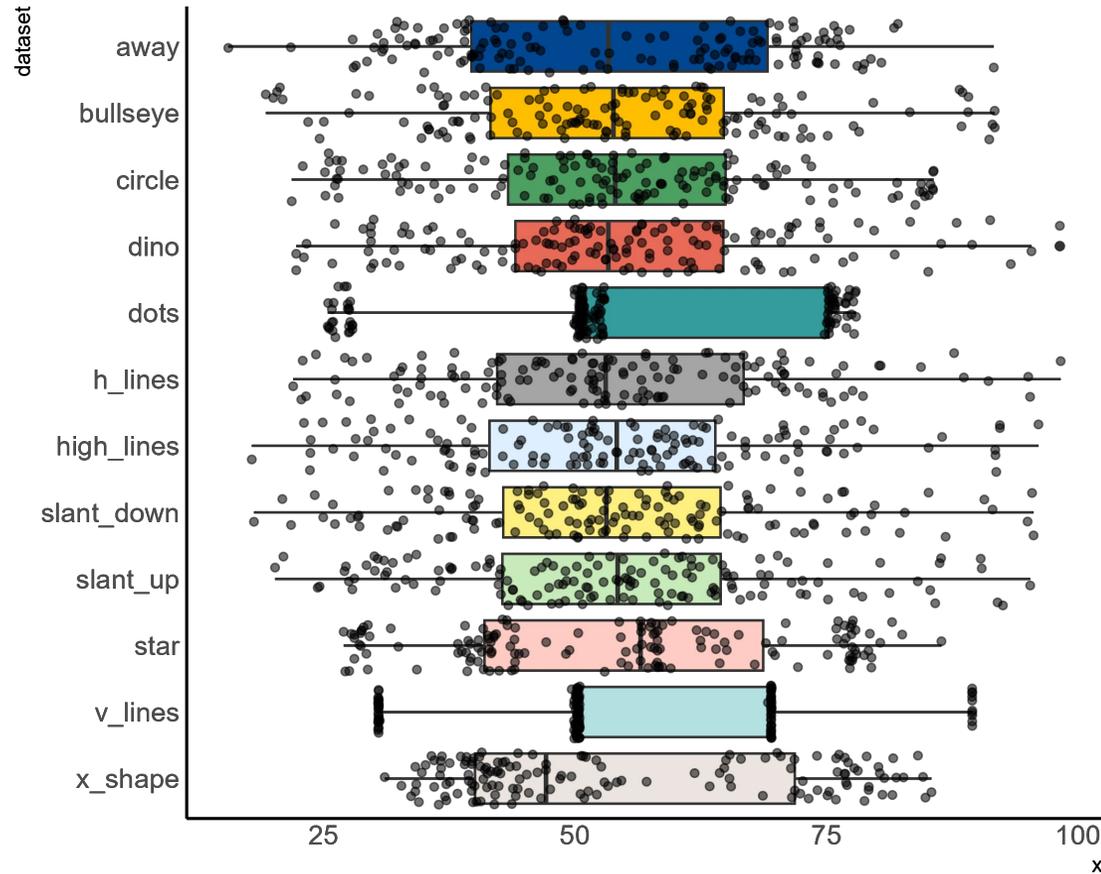

Figure 1. Data from the Cancer Cell line Encyclopedia on gene expression levels (RNA) for Small Cell Lung Cancer and Non-Small Cell Lung Cancer cell lines.

Exploring data with visualisations

- Try out different visualisations
- Look at your data from many angles
- Follow how transformations impact your data by visualising it.
Think before -> after, but include intermediary steps too
- Interactivity can be a great help, especially for “big” data.

O⁶-Benzylguanine Inhibits Tamoxifen Resistant Breast Cancer Cell Growth and Resensitizes Breast Cancer Cells to Anti-Estrogen Therapy

Joshua Smith¹, George C Bobustue¹, Rafael Madero-Visbal¹, Jimmie Colon¹, Beth Isley¹, Jonathan Ticku¹, Kalkunte S. Rivenugopal¹ and Santhi Konduri¹

¹Cancer Research Institute of M.D Anderson Cancer Center-Orlando, Texas Tech University Health Sciences Center, Amarillo, TX

Abstract

Endocrine therapies using anti-estrogens are least toxic and very effective for breast cancer, however, tumor resistance to endocrine therapy remains a leading cause for treatment failure. Based on our recent study on the treatment of the ERα-responder patient MCF7 in postmenopausal women (J Clin Oncol 35, 4647, 2016), here, we investigated whether MGMT overexpression mediates endocrine resistance. Specifically, we determined whether administration of MGMT inhibitor (OP benzylguanine (BG)) at a non-toxic dose alone or in combination with the anti-estrogen (tamoxifen) treatment curtails human tamoxifen resistant breast cancer cell growth. Further, we also determined whether BG resensitizes breast cancer to tamoxifen using tamoxifen resistant cells.

MGMT expression was found to be increased in breast cancer cells relative to normal breast epithelial cells. Also, MGMT levels were significantly higher in tamoxifen resistant MCF7 compared to the parent cells. Silencing of the ERα-expressing using a specific siRNA resulted in upregulation of MGMT mRNA and protein levels by a fold. We also observed an inverse correlation between MGMT and p53 levels in breast cancer cell lines; moreover, p53 overexpression was accompanied by increased MGMT expression. Other experiments showed that BG alone or BG in combination with tamoxifen or fulvestrant increased ERα expression, whereas tamoxifen alone and fulvestrant alone decreased the same respectively. However, all these treatments increased the p53^{wt} mRNA and protein expression significantly. BG inhibited tamoxifen resistant breast cancer growth in a dose-dependent manner and it also resensitized resistant breast cancer cells to anti-estrogen therapy (TAM/ICI). These combinations also enhanced the cyclinase C release and the PARP cleavage, indicative of apoptosis. In breast cancer xenografts, BG alone or a combination of BG with tamoxifen or fulvestrant caused significant tumor growth delay and immunohistochemistry revealed that BG inhibited the expression of MGMT, ERα, p53, p21 and increased p53^{wt} cleavage. These findings suggest that MGMT inhibition may provide a novel and effective approach for overcoming tamoxifen resistance.

Introduction

Recent advances in breast cancer research have identified key pathways involved in the repair of DNA damage induced by chemotherapeutic agents. The ability of cancer cells to recognize DNA damage and initiate DNA repair is an important mechanism for therapeutic resistance and has a negative impact on therapeutic efficacy. A number of DNA-damaging alkylating agents attack the nucleophilic O⁶ position on guanine, forming mutagenic and highly cytotoxic interstrand DNA crosslinks. The DNA repair enzyme O⁶-alkylguanine DNA alkyltransferase (MGMT), encoded by the gene MGMT, repairs alkylation at this site and is responsible for protecting both tumor and normal cells from alkylating agents. MGMT is expressed constitutively in normal cells and tissues. In breast tumors, MGMT gene expression is elevated and levels are up to 4-fold higher than in the normal breast. Interestingly, it has been shown that tamoxifen accelerates protein degradation of MGMT in human cancer cells. In pigs, Yaga, Maderal, and Fisher demonstrated that OP benzylguanine (BG) inhibited AGT and potentiated the cytotoxicity of both chloroethylating agents and methylating agents. In a series of important observations, they fully characterized the interaction between BG and AGT and its therapeutic impact. They showed that BG binds AGT, transferring the benzyl moiety to the active-site cysteine [26]. The reaction is very rapid and more potent than any other previously known AGT inhibitor. BG is not incorporated into DNA in living cells and needs direct contact with both cytoplasmic and nuclear AGT. Because BG is a pro-drug, it is converted to the active form, benzylguanine, in the cytosol. The MGMT protein is degraded after alkylation. This mechanism renders tamoxifen effectively against the AGT content in tumor and the associated repair of alkylation damage. BG is currently undergoing clinical trials to evaluate its ability to increase the efficacy of alkylating agents.

Interestingly, several observations suggest an inverse correlation between the levels of MGMT and p53 tumor suppressor protein where wild-type p53 suppresses transcription of human MGMT expression. Unfortunately, p53 function is often inactivated or suppressed in human cancers. Therefore, restoration of its activity is essential for the success of cancer treatment. However, whether or not this is mediated by upregulation of MGMT expression has yet to be determined. To date, the close link between MGMT and ERα (and the link to p53 expression) has not been explored in drug (i.e., tamoxifen) resistant breast cancer. The anti-estrogen tamoxifen is the most commonly used treatment for patients with estrogen receptor positive breast cancer. Although some patients benefit from tamoxifen in the adjuvant and metastatic settings, resistance to this selective therapeutic agent is an important clinical problem. The primary goal of present study was to investigate the mechanism of anti-estrogen drug resistance and to design new therapeutic strategies for circumventing the resistance. The results show that MGMT expression is increased in TAM-resistant breast cancers and inhibition of MGMT by BG significantly improves TAM sensitivity.

Results

Prolonged Treatment of Tamoxifen Increases MGMT Expression We developed a tamoxifen resistant MCF7 cell line by using prolonged treatment of tamoxifen on the parental ER-positive breast cancer cell line, MCF7. Tamoxifen resistant MCF7 cells proliferate at rates similar to the parental MCF7. Prolonged treatment of tamoxifen onto MCF7 cells increased MGMT expression compared to parental MCF7 cells by 4 fold (Fig.1).

Knocking Down ERα Enhances MGMT Expression in Tamoxifen Resistant Breast Cancer Cells It is not known whether ERα and MGMT transcriptionally regulate each other in tamoxifen resistant breast cancer cells. We therefore investigated whether down regulation of ERα has any effect on endogenous MGMT expression in these cells. As expected, downregulation of ERα using specific siRNA significantly reduced ERα protein levels in these cells. Moreover, this analysis was supported by the results in the 5d panel (Fig. 2A) shows that silencing of ERα increases MGMT expression in these cells, and interestingly, the results in the 8d panel (Fig.2B) show increased MGMT mRNA levels were increased as assessed by qRT-PCR. These data suggest that ERα-mediated signaling functions to repress MGMT gene expression in breast cancer cells.

Transcriptional Regulation Between MGMT and p53 Previously, it was reported that p53 negatively regulates MGMT in breast cancer cells. Therefore, we asked whether or not silencing of the p53 enhances endogenous MGMT transcription. Tamoxifen resistant MCF7 cells were treated with either p53 siRNA (p53-si) or control siRNA (p53-NC). MGMT mRNA (MGMT KD) (Fig.3B) along with non-specific siRNA (NS). MGMT expression was consistently increased in p53 knockdown cells. Different experiments showing a 4-fold upregulation (Fig. 3A) and as expected, knocking down MGMT decreased MGMT transcription when an p53 knockdown was knocking down MGMT knockdown cells (Fig.3D). These results indicate that p53 can regulate MGMT at the transcriptional level.

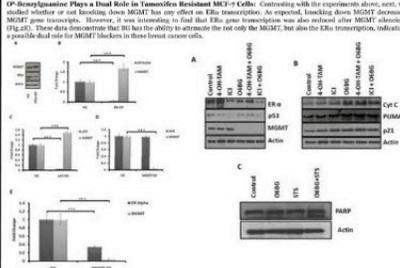

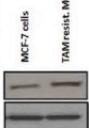

Figure 1. ERα-mediated inhibition MCF7 breast cancer cells was treated in presence or absence of ERα siRNA (control siRNA) and with or without tamoxifen for 5 and 8 days. Relative mRNA levels of MGMT were measured and p53 and MGMT expression were analyzed by Western blotting. **A**, MCF7 cells were significantly resistant to ERα knockdown cells (ERα knockdown siRNA) only and tamoxifen (TAM) (100 nM) for 5 days. **B**, MCF7 cells were significantly resistant to ERα knockdown cells (ERα knockdown siRNA) only and tamoxifen (TAM) (100 nM) for 8 days. **C**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **D**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **E**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **F**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **G**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **H**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **I**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **J**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **K**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **L**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **M**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **N**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **O**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **P**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **Q**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **R**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **S**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **T**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **U**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **V**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **W**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **X**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **Y**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting. **Z**, MCF7 cells were treated with TAM for 5 days and p53 levels were analyzed by Western blotting.

OP-Benzylguanine Inhibits Tamoxifen Resistant Breast Cancer Cell Growth and Increases Breast Cancer Cell Sensitivity to Anti-Estrogen Therapy (TAM/ICI) Initial studies revealed that all four sites had tumors in the breast. The data summarized in Table 1 show that BG alone or in combination with twice weekly tamoxifen/ICI significantly decreased median tumor volume and weight compared with that seen in tamoxifen/ICI treated and control tumor. The combination of BG with tamoxifen or ICI produced the greatest decrease in median tumor volume as compared with control mice (Fig. 4A, 4B). TAM/ICI, fulvestrant, p53, cisplatin, p53, or control mice (Fig. 4C, 4D). TAM/ICI, fulvestrant, p53, cisplatin, p53, or control mice (Fig. 4E, 4F). How to realize the Swedish potential for negative emissions from BECCS?

Malin Pehrs – Supervised by Kenneth Möllersten
Process Technology
Funded by Energimyndigheten

Bioenergy can be considered carbon neutral because the released CO₂ from combustion of biomass is taken up by regrowth of biomass.

Bioenergy with carbon capture and storage (BECCS) could thus create negative emissions.

Point source color code:

- More than 2/3 biogenic emissions
- 1/3 to 2/3 biogenic emissions
- Less than 1/3 biogenic emissions

In Sweden, there are biogenic point source emissions of approximately 33 Mton CO₂ per year, if point sources larger than 0.1 Mton CO₂ are added up [1].

Assuming a capture rate of 90%, the technical BECCS potential is approximately 30 Mton CO₂ per year.

Sweden will have 10.7 Mton CO₂ residual emissions in 2045, when Sweden shall meet the net-zero target.

BECCS can compensate for residual emissions.

Even if all compensation were met through BECCS, there would still be "excess" BECCS potential of about 19 Mton CO₂ in Sweden that is not needed to achieve the Swedish climate target.

How should this BECCS potential be realized?

Incentivizing Swedish BECCS towards the Swedish net-zero target:
- Better practices
- Incentivizing Swedish BECCS beyond the Swedish net-zero target:
- Other countries as buyers of negative emissions (e.g. via Article 6 of the Paris Agreement)
- The voluntary carbon market (e.g. companies offsetting for net-zero targets)

Accessible visualisation

Two important things about accessible viz

- Add Alt-texts

Gun murders per 100,000 people

America's private arsenal is six times as lethal as Canada's, and 30 times worse than Australia's.

The New York Times | Sources: United Nations Office on Drugs and Crime (gun murders); Small Arms Survey (guns per 100 people) | Murder data for U.S., Canada, Sweden, Switzerland, Australia and Spain from 2015 and latest available for other countries; 2007 data for guns per 100 people.

If I was posting this chart from the *New York Times* article "[How to Reduce Shootings](#)" on social media I would include a link to the article and write this alt text:

alt= "Bar chart of gun murders per 100,000 people where America's murder rate is 6 times worse than Canada, and 30 times Australia"

And contrast

In KTH Visual identity manual all allowed combinations are marked

[Contrast checker](#)

Key take-aways

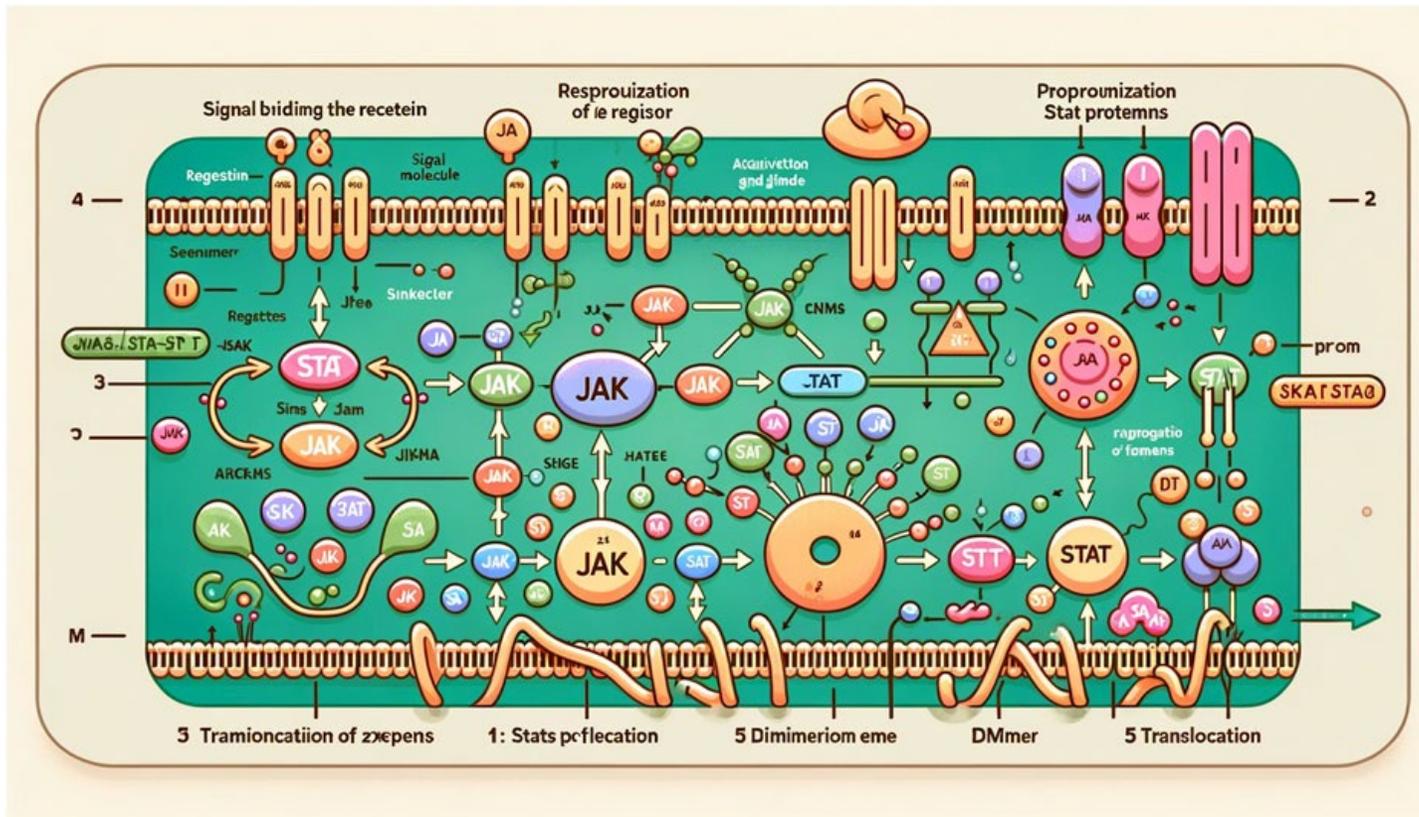

Think about where you put your research data

- Using a webservice to analyse your data usually includes uploading the data to the service.
- This is essentially sending your data to a separate server, likely in a different country.
- If you are working with sensitive data, or data with personal information this can be deeply problematic.
- If you are unsure: Ask for advice from the relevant support function at your research institute.

For KTH: researchdata@kth.se

For Aalto: researchdata@aalto.fi

AI can be helpful... and deceitful

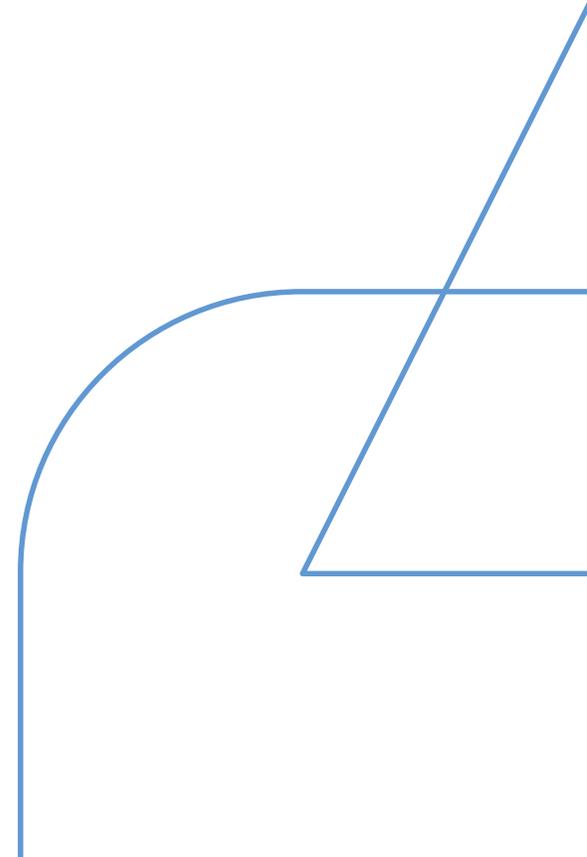

- This illustration was published and peer-reviewed (now retracted)
- It contains multiple errors made by AI
- This was one of many graphs/illustrations with errors

Blog post by Elisabeth Bik, 2024. [Source](#)

From: Guo X, Dong L and Hao D (2024) Cellular functions of spermatogonial stem cells in relation to JAK/STAT signaling pathway. *Front. Cell Dev. Biol.* 11:1339390. doi: 10.3389/fcell.2023.1339390 (RETRACTED) [CC-BY](#)

Key take-aways

- Help the viewer by directing attention
- Use consistent coloring and mind the color blind
- Reduce complexity if possible - Less is usually more
- Avoid circular representations of data
- Design to get attention
- Be creative about reaching out

Tools and Resources

Links to useful resources

- [DataVizcatalogue.com](https://www.data-viz-catalogue.com/)
Contains links to many additional resources and galleries
- [Data-to-Viz](https://www.data-to-viz.com/)
Useful decision trees for selecting graphics
- [Ktheme for R](#) and [kth-quarto](#)
Unofficial KTH colorschemes and layouts for R and quarto
- [Visual storytelling psychology](#) by Nadieh Bremer
Educational slides on the psychology behind visualisation
- [InfraVis](#) National Infrastructure for DataViz
Provides support to researchers (a lot of it free)
- [Affinity](#)
From Canva, nowadays free for everyone.
- Adobe Illustrator
Academic Licenses available through your university typically.
- [Adobe Express](#) or [Canva](#)
Free version available. Great for working with layout.
- [Python graph gallery](#)
Contains lots of examples on how to make plots in python.
- [R Graph gallery](#)
Contains lots of examples on how to make plots in R.
- [Plotly](#)
Making graphs interactive. For R, python, Matlab and more.
- [Shiny](#)
Web framework for making interactive apps. R and python.
- [Datawrapper color guide](#)
What to consider when choosing colors for data visualisation
- Colour tools:
 - coolors.co: Fast palette generator.
 - palett.es: Generate a palette from one color
 - [Color-blindness tool](#): Check your palettes.
 - [Contrast checker](#): Check your contrast
- [Tikz for LaTeX](#)
Create vector-graphics in LaTeX.

Links to useful resources

- Icons – for infographics and graphical abstracts:
 - [bioicons](#): Life science
 - [Scidraw](#): Life science
 - [bioart \(NIH\)](#): Health and Life science
 - [Wikimedia Commons](#): Everything CC-BY
- [D3.js graph gallery](#)
Contains lots of examples on how to make plots in D3.js
- [OriginLab](#)
GUI based with plugin apps for data analysis and visualisation. Popular in engineering.
- [Inkscape](#)
Free alternative to Illustrator and Affinity Designer.

Agenda

Monday 9th of February

- 10.00 FAIR data and how to check fairness of your data
- 11.00 An introduction to Data Management Plans
- 12.00 Supporting good research management practices with Electronic Lab Notebooks
- 14.00 Where will my data end up? - Selecting a high quality repository for the data underlying your published results

Tuesday 10th of February

- 10.00 Automated large-scale text analysis
- 11.00 Visualize your research data
- 13.00 BRIGHT Data Catalog -
Developing A Research Data Management Infrastructure
- 13.30 Introduction to Data Publishing and Zenodo
- 14.00 Where's the data to your article?
Learn how to prepare a Data Availability Statement

Wednesday 11th of February

- 10.00 Searching for research data
- 11.00 FAIR by Default: Building Reproducible Digital Research Projects
- 12.00 Introduction to OpenRefine
- 12.30 Licensing research data for reuse
- 13.00 Responsible Preservation of Research Data &
Data Available on Unreasonable Request

Full schedule at: www.nordiclovedataweek.org
